Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses and

Claim 144; SEQ ID NO 1034; 577pp + Sequence Listing; English.

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and

(b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abloic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office.

Novel Arabidopsis thaliana nucleic acid useful

```
transgenic plant with enhanced disease resistance and enhanced traits of interest, as probes, and in diagnosis and screening purposes
```

Claim 1; Page 158; 277pp; English.

The invention relates to Arabidopsis thaliana nucleic acid sequences. The DNA sequences and the polypeptides they encode are useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of the polypeptides, for mapping functional composition of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or biosynthetic products of withstanding a particular disease or biosynthetic products in plants and to create genetically modified and are useful for introducing or inhibiting production of transgenic organisms, such as plant cells and plants. Transgenic plants are useful for introducing or improving disease resistance and stress tolerance in plants, screening biologically active agents, such as information or improving disease resistance and stress tolerance in plants, screening biologically active agents, such as information or interest or intere biosynthetic pathways of nutritional, commercial or medici. Sequences ABX60655-ABX61554 represent Arabidopsis thaliana polynucleotides of the invention

New Arabidopsis thaliana nucleic acid, for identifying homologous genes, producing compositions that modulate the expression or function of its encoded protein, and mapping functional regions of a protein

Claim 1, SEQ ID 615; 44pp; English.

comprising a sequence capable of hybridishing under stringent conditions.

To a sequence (SI) selected from any one of the 99s sequences given in the 248194334. (I) have insecticide and fungicide activities, and they can be used as protein expression modulators. (I) can be used in identifying homologous or related genes, in producing compositions that modulate the expression or function of their encoded proteins, mapping functional regions of the proteins, and in studying associated physiological pathways (I) can also be used. (I) for the genetic physiological pathways (I) can also be used. (I) for the genetic of thistanding a particularly plant cells, (2) in screening assays of various plant strains to describe environmental stress; (3) for enhancing or inhibiting production of a biosynthetic product in a plant; (4) as probes in mapping and in diagnosis; in genetic modification and conscreening purposes; to generate additional copies of the nucleic The present invention describes an Arabidopsis thaliana nucleic acid (I) acids, to generate ribozymes or antisense oligonuclectides, and as single-stranded DNA probes or as triple-strand forming oligonuclectides; and (5) for generating genetically modified transgenic organisms. for this patent did no btained in electronic Note: The sequence data for this specification, but was obtained

The invention relates to 1 of 232 isolated or recombinant polynucleoticus encoding an Arabidopsis thaliana transcription factor, their variants, encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% complements fragments, or related polynucleotide with 31% to 95% to a wild-type or reference plant, or the plant compared to a wild-type or reference plant, or the plant or whibits an altered phenotype as compared to a wild-type or reference plant, or the plant or wild-type or reference plant, or the plant or a transgenic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynuclectides, a computer of readable medium having stored sequence information selected from one of 46% fully defined sequences of incomation a plant having a homologue sequences given in the specification. The isolated or recombinant polynuclectide is used for producing a plant having a modified trait, the method comprising selecting a plant to overexpress of the polypeptide or antisense nucleic acid, inserting a modified or introducing the vector into a plant or a call of a plant to overexpress introducing the vector into a plant or a call of a plant to overexpress or production of agriculturally useful proteins or metabolic chemicals, microbial disease resistance, herbicide realstance, seed and fruit yield, growth real, leaf and flower senescence and many other traits listed in the received in the present sequence is one of the 232 polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   248

encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comparising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to 1 of 232 isolated or recombinant polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      recombinant polymucleotide is used for procured a polymucleotide unit modified trait, the method comprising selecting a polymucleotide trait, the method comprising selecting a polypeptide or an antisense nucleic acid, inserting the encodes a polypeptide or antisense nucleic acid into an expression vector, polymucleotide or antisense nucleic acid into an expression vector, polymucleotide or antisense nucleic acid into an expression vector into a plant or a call of a plant to overexpress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An isolated or recombinant polynucleotide used to produce a transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Keddie J;
Pineda O;

plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 polynucleotides encoding an A. thaliana transcription factor.

Arabidopsis thaliana expressed sequence related polynucleotide #332. Transgenic plant; plant; genetically modified cell; environmental stress; ribozyme creation; disease resistance; 25-FEB-2003 CDC2a 412 ( 331 ABX62217; ESULT 9 BX62217

correction and CDC2b are the only CDK genes to have been characterized in detail in Arabidopsis thaliana. They were used as bait in a two-hybrid screening assay with a cDNA library of a plant cell suspension as prey. The plant cell cycle interacting proteins identified were designated caids, vectors comprising them, the proteins they express, antibodies that bind to them and or inhibitors of their protein expression and/or contriby may be used for modulating the cell cycle in an animal or plant, cycle proteins and/or growth, for influencing the activity of cell cycle proteins in a plant or animal cell, as positive or negative regulators of cell proliferation, for modifying the growth inhibition caused by environmental stress conditions, especially change in a mormal or suboptimal nutrient conditions, especially confined in a conditions, especially confined in a condition of conditions or activators of the conditions of conditions and conditions and conditions and conditions and conditions are activators of conditions and conditions and conditions and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators and conditions are activators. The VbDBP clone is very similar to the A. thaliana putative DNA binding protein and also contains a lot of homologies with Oryza sativa PCF2. VbDBP interacts with cyclin-dependent protein kinase (CDK) CDC2b but not regulatory sequences may be used a markers in plant or animal cell and tissue cultures or as a marker in marker-assisted plant breeding. The regulatory sequences may also be used for the expression of heterologous DNA sequences during a stage of the cell cycle. Nucleic acids encoding plant cell cycle interacting proteins, useful for regulating plant growth and in recombinant DNA protocols plants. The DNA sequences and their herbicides and/or Inze D; Sequence 1081 BP; 302 A; 195 C; 266 G; 318 T; 0 other; Torres Acosta JA, of cell cycle protein, as growth regulators, inducing nematode resistance in plants. Novel Arabidopsis thaliana nucleic acid useful for identifying homologous or related genes, and to create genetically modified and transgenic organisms, such as plant cells and plants WPI; 2003-110411/10.

Claim 1; SEQ ID NO 332; 43pp; English:

The invention describes an Arabidopsis thaliana nucleic acid (I). The polypeptide (II) encoded by (I), transganic plant (III) or genetically modified cell (IV) are useful for screening accandidate agent for its biological effect, by combining the candidate agent with (II), (III) or (IV), and determining the effect of the candidate agent on (II), (III) or producing compositions that modulate the expression or function of its encoded protein, for mapping functional regions of the protein, for studying associated physiological pathways, for genetic manipulation of cells, preferably plant cells, infectening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or environmental stress, for enhancing or inhibiting production of biosynthetic product far a plant, for producing polypeptides, as probes for the detection of amancing or inhibiting production of biosynthetic product in a plant, for samples, to generate additional copies of (I), to generate ribozymes or oligonucleotides, as single stranded DNN probes or as tribigle stranding oligonucleotides, and to creat genetically modified and set of the strander of services and the strander of services and strains of coreat genetically modified and set of the strander of services or creat genetically modified and set of the strander of services and strains and the oreat genetically modified and set of the strander of services and services and services or creat genetically modified and set of the services or coreat genetically services and services or creat genetically services and services and services or creat genetically services and services or creat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or coreat genetically services or cor seful for introducing or lawrovens carrive agents, e.g., olerance in plants, screening biological active agents, e.g., occurring Arabidopsis thaliana expressed seguences. Note: The seguence data for this patent did not form part of the printed ransgenic organisms, such as plant cells and plants. (II) or (III) is seeful for introducing or improving disease resistance and stress suhanced tolerance to environmental stress, or to produce a factor. sequence represents a nucleic acid that may correspond to naturally raits of interest, for screening programs, as crops which exhibit oides, insecticides, etc., and for elucidating blochemical is useful as crops for their enhanced diseased resistance.

controlled as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included care a transgenic plant crampts as compared to a wild plant. Also included readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant equences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, inserting the polympeptide or antisense nucleic acid, thereby producing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified producing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth search, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 polynucleotides
                                                                                                                                     The invention relates to 1 of 232 isolated or recombinant polynucleotides encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 268
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                162
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   282

The invention relates to 1 of 232 isolated or recombinant polynucleotides of encoding an Arabidopsis thallana transcription factor, their variants, or encoding an Arabidopsis thallana transcription factor, their variants, or encoding an Arabidopsis thallana transcription factor, their of 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant comprise a scongared to a wild plant exhibits an altered compression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, and identifying a homologue sequence from a database comprising a polynucleotide from one of sequences comprising inputting sequence. Information selected from one of sequences comprising inputting sequence information selected from one of the fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a polynucleotide that encodes a polypeptide or antisense nucleic acid into an expression vector.

Combinate polypeptide or antisense nucleic acid into an expression vector. Introducing the vector into a plant or a cell of a gariculturally useful proteins of acid increased plant, and selecting for a manisense nucleic acid into an expression vector. Computation of agriculturally useful proteins of a compute of agriculturally useful proteins of a draw of agriculturally useful proteins of a draw of a gariculturally useful proteins of a compute of agriculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful proteins of a draw of a gariculturally useful p

to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits eccopic expression or altered expression or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polymucleotides, a computer or readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polymucleotide is used for producing a plant having a modified trait, the method comprising selecting a polymucleotide that encodes a polypeptide or an antienne nucleic acid, inserting the coopyration of an antienne nucleic acid into an expression vector, introducing the vector into a plant or a call of a plant to overexpress the polypeptide or antienne nucleic acid, thereby producing a modified production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. increased producing a plant plant or a call of a increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistence, herbicide resistance, seed and fruit yield, growth rate, lasf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 polynucleotides encoding an A. thaliana transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

```

The invention relates to an isolated nucleic acid molecule (1), maize yellow stripe 1 (ys1) or yellow stripe1-like (ys1) from Arabidopsis (ABN85763-ABN85771). (1) is useful for generating transgenic plants which metal or heavy metal contaminate from soil and for bioremediation of metal or heavy metal contaminated soil. (1) may also be used to aler the distribution of iron within the plant body so that edible parts of crop plants brave more iron. Transgenic plants may also be used in conventional plant breeding schemes to produce progeny which also contain the gene of interest. The present sequence is that of the Arabidopsis ysl encoding cDNA of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 atggcgacaattcagaagct.........cacggtcatcgaaccactga 1071

Application US/07982712

Patent No. 5456391

CENERAL INFORMATION:

APPLICANT: Hideys FUJIMOTO, Kimiko ITOH

APPLICANT: Mikihiro YAMAMOTO, and Ko SHIMAMOTO

TITLE OF INVENTION: Insecticidal Protein-encoding Gene,

TITLE OF INVENTION: Plants Transformed with the Gene, an NUMBER OF SEQUENCES: 35

CORRESPONDENCE ADDRESS:

ADDRESSEE: Wenderoth, Lind & Ponack

STREET: 805 Fifteenth Street, N.W., #700

CITY: Washington

GENERAL INFORMATION:
APPLICANT: Fraser et al.
TILLOANT: Fraser et al.
TILLOANT: Fraser et al.
TILLOANT: Fraser et al.
TILLOANT: Fraser et al.
Patent No. 633773
TILLOANT: Thereof, and Uses Thereof
FILLS PATENTION: Thereof, and Uses Thereof
CURRENT APPLICATION NUMBER: US/08/545,528D
CURRENT FILING DATE: 1995-10-19
PRIOR APPLICATION NUMBER: US 08/483,018
PRIOR APPLICATION NUMBER: US 08/473,545
PRIOR PILING DATE: 1995-06-07
NUMBER OF SED ID NOS: 1
SOFTWARE: Patentin version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3092

Arabidopsis full-length conA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

The mRNA sources were 1) quantities of 4 pools of mRNA. The mRNA sources were 1) grown roots, 3) steaded plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and saliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TCTAACCATCATCAACGGCGTCAGAAACGTCGAAACTTCAAGACCTTTCCAAGTAAATCC 120

The scion was Washington Navel orange and the roctetock Carizzo Citrange. Tissue from	mature fruit was harvested at mid-day in January 2002 during a cold spell, when pre-dawn temperatures were approximately -2 to 2 degree C. Approximately 2 m median serrions of the rind were excised in the field from	several fruits, then wrapped in aluminum foil and frozen quickly in dry ice. Total RNA was extracted using a phenol extraction procedure described in J. Japanaese Soc. Hort. Sci. (1995) 64:809-814. Polv(A) RNA was purified, a cDNA	library was made, and 1 million primary lambda cDNA clones were in vivo excised to give a population of pBluescript

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠ
SK(-) phagemids. All steps to this point were performed in the TU Close lab at the University of California, Riverside (Fenton). Phagemids were plated, plasmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an AB1350 at the Arizona Genomics Institute, University of Arizona (Collura , Feuerbacher, Kim, Kudrna, Wing, Yu). Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Wanmanker) using the HarvEST pipeline (http://harvest.uor.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region of at least 100 bases were deposited to GenBank."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AU239448
